

Task #48801 - Virtual Hosting in User Directory

Instructor: [Instructor Name]

Date: 07 April 2026

Assignment Details

Host a simple PHP website in a user home directory.

1. Create a new user named Alice
2. Create a sample web page under a directory named public_html (/home/sam/public_html)
3. Access the website using URL: myfirstwebsite.test and www.myfirstwebsite.test

Webpage content:

<?php phpinfo(); ?>

Instructions and Guidelines

1. Create a new user named sam

```
# useradd sam
```

2. Create a sample web page under a directory named public_html (/home/sam/public_html)

```
# mkdir -p /home/sam/public_html
```

```
# echo "<?php phpinfo; ?>" > "/home/sam/public_html/index.php"
```

```
# sudo setsebool -P httpd_enable_homedirs on
```

This command tells selinux that httpd/Nginx can read/write on to home directory

```
# sudo semanage fcontext -a -t httpd_sys_content_t  
"/home/sam/public_html(/.*)?"
```

Labels all files and directories including and under /home/sam/public_html/ for httpd to access

```
# sudo restorecon -Rv /home/sam/public_html
```

To persist the changes even after relabeling happens

3. Access the website using URL: myfirstwebsite.test and www.myfirstwebsite.test

Add the public IP of the AWS instance in `/etc/hosts` and after a space mention the domain name, its only applied locally.
