

Task #48803 - Introduction to Web Hosting

Instructor: Nitha

Date: 06 April 2026

Assignment Details

- i. Install Apache Web Server
 - ii. Create an index.html page in default document root
 - iii. Access the website using mysamplewebsite.itfs
- Note: Create a custom Virtual Hosting configuration File
- Keep backup of system configuration files before editing
- Study in detail about Apache default files, document root and modules

Instructions and Guidelines

1. Install all packages

```
# dnf install -y httpd
```

2. Create an index.html page in default document root

```
# echo "web hosting" > "/var/www/html/index.html"
```

3. Access the website using URL: mysamplewebsite.itfs

Add the public IP of the AWS instance in /etc/hosts and after a space mention the domain name, its only applied locally before that cp /etc/hosts /to/your/backup/directory

```
[root@ip-172-31-47-147 ~]#  
[root@ip-172-31-47-147 ~]# systemctl enable --now httpd  
[root@ip-172-31-47-147 ~]# echo "web hosting" > "/var/www/html/index.html"  
[root@ip-172-31-47-147 ~]# cp -pf /etc/hosts .  
cp: overwrite './hosts'? y  
[root@ip-172-31-47-147 ~]# echo "172.31.47.147 mysamplewebsite.itfs" >> /etc/hosts^C  
[root@ip-172-31-47-147 ~]# curl 172.31.47.147  
web hosting  
[root@ip-172-31-47-147 ~]# curl http://mysamplewebsite.itfs  
web hosting  
[root@ip-172-31-47-147 ~]# curl mysamplewebsite.itfs  
web hosting  
[root@ip-172-31-47-147 ~]#
```
